

WHAT ARE HYDROCARBONS? WHAT ARE ITS TYPES?

The simplest organic compounds containing Carbon and Hydrogen are called Hydrocarbons. e.g. Ethane, Ethene, Ethyne etc.

TYPES OF HYDROCARBONS

Hydrocarbons are of two types:

SATURATED HYDROCARBONS: A hydrocarbon in which the carbon atoms are connected only by single bonds is called saturated hydrocarbon. (C-C and C-H types of bonds)

- The hydrocarbons like methane, ethane, propane, butane etc form a series of compounds called Alkanes.
- The name of all the saturated hydrocarbons ends with 'ane'
- The general formula for saturated hydrocarbons or Alkanes is $C_n H_{2n+2}$
- The saturated hydrocarbons are chemically not reactive.
